Landscape variables . . . . .	1
-------------------------------	---

## Landscape variables

- **Variables:** land use/cover classes, elevation and derived (TPI)
- Where should I get the elevation (dem, slope, aspect) from? g\_Elevation\_Fenoscandia?
- g\_Elevation\_Fenoscandia\_TPI: all maps with 50m. Should I resample them to 100m?
- How to match land use classes from maps from Sweden and Norway? Or should we use a single map for the whole region (a regional or Europe land use map)?
- Define the above question before running density maps for land use
