Connect to GRASS GIS

We start by connecting the R session to GRASS GIS, in my local user mapset (u_bernardo.brandao).

```
# Connect to GRASS
NinaR::grassConnect(location = "ETRS_33N", mapset = "user")
# example of command
# execGRASS("g.mapset", parameters = list(), flags = )
```

Get read access to the existing mapsets

```
# list all mapsets
sep <- " "
all mapsets <- execGRASS("g.mapsets", flags = c("1"), intern = T) %%
  strsplit(sep) %>%
  first()
# list mapsets for "rein"
mapset_patt_rein <- c("Rein", "rein") %>%
  paste(collapse = "|")
mapsets_rein <- all_mapsets %>%
  grep(pattern = mapset_patt_rein, value = T)
# list mapsets for "Prodchange"
mapset_patt_pc <- c("change") %>%
 paste(collapse = "|")
mapsets_pc <- all_mapsets %>%
  grep(pattern = mapset_patt_pc, value = T) %>%
  grep(pattern = paste(mapsets_rein, collapse = "|"), invert = T, value = T)
# list some more mapsets we know we'll use
land_use_mapsets <- c(</pre>
  "p_RenRein_norut", "g_LandCover_Norway_NORUT_SAM_TT",
  "p_prodchange_envpolyTT"
landscape_mapsets <- c(</pre>
  "g_Elevation_Fenoscandia", "g_LandCover_Fenoscandia_PHENOLOGY_SAM_TT",
  "g_Elevation_Fenoscandia_TPI"
climate_mapsets <- c(</pre>
  "g_BiogeographicalRegions_Norway_PCA_klima", "u_bram.van.moorter",
  "g_EnergyResources_Fenoscandia", "u_torkildtveraa"
infrastructure_mapsets <- c(</pre>
  "p_prodchange_envpointsTT", "p_prodchange_roadsTT", "p_RenRein_trails2",
  "p_prodchange_trailsTT"
all_relevant_mapsets <- c(</pre>
  mapsets_rein, mapsets_pc,
  land_use_mapsets, landscape_mapsets,
  climate_mapsets, infrastructure_mapsets
) %>%
  unique()
# access to those mapsets
execGRASS("g.mapsets", parameters = list(mapset = all_relevant_mapsets))
```

Create new mapsets

Let's create the new mapsets here. There are six mapsets:

• climate_phenology

- landscape
- species
- industr
- transport_urban
- urban

Describe the idea of each one here.

```
# Create mapsets
mapsets <- c(
    "climate_phenology", "landscape", "species",
        "industry", "transport_urban", "tourism"
)
mapsets <- paste0("p_sam_", mapsets)

for (ms in mapsets) {
    execGRASS("g.mapset", parameters = list(mapset = ms), flags = "c")
}</pre>
```

Load data

Before starting to load data, we define here some paths to the folders where the datasets are located. If it is necessary, one can simply change the path and re-load the data.

```
# Define paths
# root folder Sweden
sw_dir <- "/data/P-Prosjekter/41203800_oneimpact/sam_raw_sw/"</pre>
```

Load landscape data

Data from Norway

Here we'll copy the datasets from Norway that have already been in use in the previous projects (e.g. Renewable Reindeer, Prodchange).

Land use - NORUT

```
# go into mapset
ms <- "p_sam_landscape"
execGRASS("g.mapset", mapset = ms)

#---
# settings
type_of_info <- "landscape"

#---
# land use
ms_from <- "p_RenRein_norut"
maps <- execGRASS("g.list", type = "raster", mapset = ms_from, intern = T)

# copy
for (i in maps) {</pre>
```

```
map_in <- pasteO(i, "@", ms_from)</pre>
  map out <- i
  execGRASS("g.region", raster = map_in)
  execGRASS("g.copy", raster = paste0(map_in, ",", map_out), flags = c("overwrite"))
}
# document
md_file <- list.files("../data/", pattern = "spatialdb_metadata_oneimpact", full.names = T)</pre>
md <- readr::read_csv(md_file)</pre>
# maps used or not used earlier
used <- grep("100", maps, value = T)</pre>
not_used <- setdiff(maps, used)</pre>
used_names <- c(</pre>
  "agricultural lands", "glacier", "grasses", "heather in lowland", "heather in ridges",
  "heathlands", "forest with lichens", "lichens", "meadows", "mires", "ridges", "forest",
  "snow", "snowbed"
used_names <- paste0("Land cover: ", c(used_names))</pre>
not_used_names <- used_names</pre>
# used maps
md_updated <- update_metadata(md,</pre>
  maps = used,
  type_of_info = type_of_info,
  mapset_from = ms_from,
  new_mapset = ms,
  variables = used_names,
  institution = NA,
  description = NA,
  unit = NA,
  type_data = "raster",
  original_range_values = "0, 1",

  unit = NA,
  type_data = "raster",
  original_range_values = min_max,
  year_data = NA,
  original_pixel_res = NA, # ??
  final_pixel_res = 100,
  extent = "Norway",
  primary_derived = "Derived",
  derived_form = "???",
```

```
website = NA,
source = NA,
obtained_through = "NINA",
observations = NA
)
md_updated

# write updated metadata on the disk
readr::write_csv(md_updated, file = paste0(
    "../data/spatialdb_metadata_oneimpact_",
    gsub("-", "", lubridate::today()),
    ".csv"
))
# put the old metadata file in archive
# system(paste("mv", md_file, "../data/old_metadata"))
```

Data from Sweden

Here we load the landscape datasets from Sweden into GRASS GIS.

Land use NMD, SMD, and Lichen model

```
# go into mapset
ms <- "p_sam_landscape"</pre>
execGRASS("g.mapset", mapset = ms)
#---
# settings
type_of_info <- "landscape"</pre>
#---
# folder
landscape_dir <- paste0(sw_dir, "03_raster/sam_landscape/")</pre>
# load vegetation data - NMD
execGRASS("r.import",
  input = paste0(landscape_dir, "landcover_nmd_ungeneralized/nmd2018bas_ogeneraliserad_v1_0.tif"),
  output = "landcover_sw_nmd1_ungeneralized_10m_2018"
# load auxiliary vegetation data - SMD
execGRASS("r.import",
  input = paste0(landscape_dir, "landcover_smd_generalized_2013/mosaic/smdb99.tif"),
  output = "landcover_sw_smd_25m_2004"
)
# elevation, aspect, slope, tpi, 10m resampled from 2m - should I add?
# load general lichen map for Sweden - Sven
execGRASS("r.import",
  input = paste0(landscape_dir, "lichen_sven/lav_model_south_no_roads_masked.tif"),
  output = "lichen_model_sw", flags = "overwrite"
)
```

```
# update metadata
# read metadata from Swedish metadata
md_sw <- readr::read_csv("../data/spatialdb_metadata_sweden_20211101.csv")[1:19]</pre>
# read new metadata file
md_file <- list.files("../data/", pattern = "spatialdb_metadata_oneimpact", full.names = T)</pre>
md <- readr::read_csv(md_file)</pre>
# pattern to search in the Swedish db
patt <- c("ungeneralized", "smd_25m", "lichen_Sweden")</pre>
# find which lines correspond to these maps in the original sweden db
ind <- purrr::map_int(patt, ~ grep(., md_sw$`Layer name`))</pre>
# final map names
maps <- c(
  "landcover_sw_nmd1_ungeneralized_10m_2018", "landcover_sw_smd_25m_2004",
  "lichen_model_sw"
)
md_updated <- update_metadata_existing(md, maps = maps, indexes = ind, existing_metadata = md_sw)</pre>
md_updated
\# write updated metadata on the disk
readr::write_csv(md_updated, file = paste0(
  "../data/spatialdb_metadata_oneimpact_",
  gsub("-", "", lubridate::today()),
  ".csv"
))
# put the old metadata file in archive
# system(paste("mv", md_file, "../data/old_metadata"))
```

We still need to process some data - doing operations like resampling for a single same resolution, mosaicing maps, calculating densities etc..

Load climate and phenology data

Now we import climate and phenology related data.

Data from Norway

Here we'll copy the datasets from Norway that have already been in use in the previous projects (e.g. Renewable Reindeer, Prodchange).

Climate PCAs from Norway

```
# go into mapset
ms <- "p_sam_climate_phenology"
execGRASS("g.mapset", mapset = ms)
#---
# settings
type_of_info <- "climate_phenology"</pre>
```

```
#---
# PCAs 1 and 2
ms_from1 <- "g_BiogeographicalRegions_Norway_PCA_klima"</pre>
maps1 <- execGRASS("g.list", type = "raster", mapset = ms_from1, intern = T)</pre>
# PCAs 3 and 4
ms_from2 <- "u_bram.van.moorter"</pre>
maps2 <- execGRASS("g.list", type = "raster", mapset = ms_from2, intern = T) %>%
  grep(pattern = "klima", value = T)
ms_from <- c(rep(ms_from1, 2), rep(ms_from2, 2))</pre>
maps <- c(maps1, maps2)</pre>
# copy
for (i in 1:length(maps)) {
  map_in <- pasteO(maps[i], "@", ms_from[i])</pre>
  map_out <- maps[i]</pre>
  execGRASS("g.region", raster = map_in)
  execGRASS("g.copy", raster = paste0(map_in, ",", map_out), flags = c("overwrite"))
}
# document
md_file <- list.files("../data/", pattern = "spatialdb_metadata_oneimpact", full.names = T)</pre>
md <- readr::read_csv(md_file)</pre>
map_names <- paste0("Norway climatic PCA", 1:4)</pre>
# get min and max from GRASS maps
min max <- get univar(maps, vars = c("min", "max"), all together = F)
min_max <- apply(min_max, 1, function(x) paste0("[", paste(round(x, 4), collapse = ", "), "]"))</pre>
# description
desc <- paste("PCA axes from climatic variables for Norway, from Bakkestuen, V., Erikstad, L., and Halvors
Step-less models for regional environmental variation in Norway. Journal of biogeography, 35(10):1906-1922
derived_fr <- paste("Fifty-four climatic, topographical, hydrological and geological. See Bakkestuen et al
details")
md_updated <- update_metadata(md,</pre>
  maps = maps,
  type_of_info = type_of_info,
  mapset_from = ms_from,
  new_mapset = ms,
  variables = map_names,
  institution = NA,
  description = desc,
  unit = NA,
  type_data = "raster",
  original_range_values = min_max,
  year_data = NA,
  original_pixel_res = 1000, # ??
  final_pixel_res = 100,
  extent = "Norway",
  primary_derived = "Derived",
  derived_form = derived_fr,
```

```
website = NA,
source = NA,
obtained_through = "NINA",
observations = NA
)

md_updated

# write updated metadata on the disk
readr::write_csv(md_updated, file = pasteO(
    "../data/spatialdb_metadata_oneimpact_",
    gsub("-", "", lubridate::today()),
    ".csv"
))

# put the old metadata file in archive
# system(paste("mv", md_file, "../data/old_metadata"))
```

Phenology variables from Fennoscandia

The phenology variables seem to be available for the whole Fennoscandia (mapsets g_LandCover_Fenoscandia_PHENELOGY*). However, the variables currently available were created only for the extent of Norway, and I cannot find the files, mapsets (e.g. g_LandCover_Fenoscandia_PHENOLOGY_average does not exist in the server), or scripts used to create them. Maybe we could re-calculate all that for the whole Fennoscandia?

Check that with Knut and Torkild.

Data from Sweden

Here we load the landscape datasets from Sweden into GRASS GIS.

Predators?

```
# go into mapset
execGRASS("g.mapset", parameters = list(mapset = "p_sam_species"))
# folder with raw data
species_dir <- paste0(sw_dir, "03_raster/p_sam_species/")</pre>
# list maps in folder
files <- list.files(species_dir, pattern = "tif$", full.names = T)
test <- terra::rast(files[1])</pre>
plot(test)
# load predators data into GRASS
for (i in file) {
  # prepare input name
  name <- strsplit(i, "/", fixed = T)[[1]] %>%
    dplyr::last() %>%
    gsub(pattern = ".tif", replacement = "")
  \# execGRASS("r.in.gdal", parameters = list(input = i, output = name), flags = c("overwrite"))
  execGRASS("r.import", parameters = list(input = i, output = name), flags = c("overwrite"))
```

}

document

Load species data

Now we import species/biotic related data.

Data from Norway

Here we'll copy the datasets from Norway that have already been in use in the previous projects (e.g. Renewable Reindeer, Prodchange).
